The article analyzes the features of the production of judicial land tenure examination in relation to private easement. The scientific significance of the article consists in summarizing the procedure for conducting judicial land surveying examination in relation to easement in legal and technical aspects. The study is carried out by summarizing the principles of establishing the easement of land plots, communicating the general characteristics of the methods of expert research in establishing easement, formulating individual assumptions when establishing a servitude. As a result, conclusions were drawn that the relevance of creating production methods for land management expertise in establishing (private) easement is dictated by the rapidly growing needs of Russian society to establish such relations. It was also concluded that the expert, conducting land surveying research, must adhere to certain provisions adopted for the production of land surveying expertise of this type.

Key words: easement, forensic examination, state cadastral registration.
